

## SAFELY HANDLE CHEMICALS

MSDS\* (Material Safety Data Sheets) explain potential hazards associated with chemical products and how to **AVOID THEM**. MSDS provide the following information:

1. How to use the product safely and how it can harm you if you don't.
2. First aid treatment and the hazards associated with the use of the product.
3. Ingredient breakdowns, description of the chemicals, fire and explosion information.
4. Preventative measures.
5. Disposal and clean up of spills.

Keep MSDS near the first aid kit in case of an **EMERGENCY** and take them to the hospital with the patient. A second copy must be kept in the manager's office as back up.
